

### **ABSTRACT OF THE DISCLOSURE**

An apparatus for supplying chemicals in a chemical mechanical polishing (CMP) process includes a plurality of chemical solution supply sources for supplying different chemical solutions in a pump-less manner by using a pressure applied at the chemical solution supply sources, each supply source having an associated feed line, re-circulating line, and means for measuring and controlling flow rates of the chemical solutions supplied through the feed lines. The chemical solutions are delivered via a plurality of delivery lines to a mixer, thereby providing a mixed chemical solution to a chemical injection part of a polishing apparatus. Each means for measuring and controlling flow rates is mounted in the feed lines.
